A computer is a device that can be instructed to carry out sequences of arithmetic or logical operations automatically via computer programming. Modern computers have the ability to follow generalized sets of operations, called programs. These programs enable computers to perform an extremely wide range of tasks. Psychology is the science of behavior and mind (not to be confused with neuroscience, which studies the neural underpinnings of psychological phenomena ex. neural circuits). Psychology includes the study of conscious and unconscious phenomena, as well as feeling and thought. It is an academic discipline of immense scope. Psychologists seek an understanding of the emergent properties of brains ... Cognitive psychology became of great importance in the mid-1950s. Several factors were important in this: Disatisfaction with the behaviorist approach in its simple emphasis on external behavior rather than internal processes.; The development of better experimental methods. Finally, let's point out some positive effects of gaming. Research has shown that as opposed to non-gamers, gamers had better visuo-motor coordination, spatial representation, iconic skill, and visual attention 8. Furthermore, recently there's been a change in focus in the gaming world, where people have had an interest in using games for a purpose other than just entertainment.
